TinyKlok Cracked Accounts is a small application with a very good idea, making it possible to accurately and reliably track the time spent in programs. What's more, the application shows exactly where you spent your time in the current window. For instance, it can be set to

track the time spent in a web browser, or in a specific application, all from a single interface. Moreover, it can also be used to monitor Internet usage, searching, and downloading. This is actually the main idea of the application, making it possible to keep track of your time usage and improve efficiency. TinyKlok Activation Code is an incredibly simple application which sits on the desktop and keeps track of your time. This sort of arrangement, in theory, would be much more accurate than manually logging the time. However, it comes with a hidden downside: it

doesn't get any accurate results. That is to say that if the clock changes during the time being tracked, the application won't be able to show accurate results. For instance, when not logged into the system, the clock changes twice a minute, and when the system is in hibernation, the clock changes once every hour. Even when logged in, the clock will never be updated because the system will most likely be asleep. This may seem like a rather significant issue, but if you want to have an accurate log, it's really a problem. As a workaround, you could set the clock to local time

when you first boot the system. This will ensure the clock is accurately updated, and if the application is meant for work, you may not have to worry about it. Whether you want to track your time, or simply set the time, TinyKlok is a surprisingly useful application, thanks to its simple and intuitive interface. However, it's incredibly easy to make a mistake when using it. Therefore, if you're going to use this application to track your time and use it for work, it's advisable to have a clock set to your local time. TinyKlok Description: TinyKlok is a small
